Asset Health Score

AI Executive Summary

SLW0421 shows moderate health at 67.4% with a failure probability of 31.8%. Two active fault codes are detected and the vehicle has exceeded its 90-day service interval by 6 days. Brake health at 65% requires urgent attention.

AI Recommendations

CRITICAL

- Schedule brake inspection and pad replacement within 7 days

HIGH

- Perform full diagnostic scan for 2 active fault codes before next route
- Book service appointment — predicted maintenance window closes 2024-05-12

MEDIUM

- Monitor coolant temperature trend — consider coolant system flush
- Plan tire replacement within next 30 days (health at 72.5%)
- Schedule oil change at the upcoming service event

Maintenance Insights

- Vehicle has exceeded recommended service interval by 6 days (96 vs 90 days)
- Brake health (65%) is below the 70% safe threshold — action required within 7 days
- Coolant temperature reached 97.4°C — monitor for head gasket stress
- 2 active fault codes detected — full diagnostic scan recommended
- Oil life at 45% — schedule oil change at next service

Future Predictions

Next Failure Probability	Optimal Maintenance Date	
31.8%	2024-05-06	
Suggested Maintenance Type	Est. 6-Month Cost	
preventive	LKR 185,000	
Performance in 6 Months	Est. Remaining Life	
declining without intervention	8-10 months	

Conclusions & Next Steps

Executive Conclusion

SLW0421 requires urgent brake inspection and a full diagnostic scan before the next route assignment. Without intervention within 14 days, failure probability rises above 60%. Proactive maintenance now costs approximately LKR 42,500 versus a reactive repair cost of LKR 68,000+.

Optimisation Recommendations

- Reduce idle time — vehicle idled 12.5 hours in last 90 days
- Route optimization can reduce km-driven by ~15% based on trip count data
- Preventive brake service now vs corrective later saves approx LKR 28,000
